a-kit Installation

This page describe the <u>**two steps**</u> needed for A-Kit installation.

- **Download and install Pluggo Runtime (free)**. Pluggo Runtime is a library required by **A-Kit** to be hosted in your sequencer. Pluggo has been created by Cycling'74. Choose your file to download **(freely)** for **Windows XP** in **"Pluggo Runtime"**, link below, then follow the instructions for installation.

    http://www.cycling74.com/downloads/pluggo

  ◇ If you already host a recent version of Pluggo installed in your system, go to step 2.
  ◇ Other Pluggo's versions available in the link are commercial versions: they'll install about 100 plugins compatibles with Pluggo in demo mode. These versions **aren't required** for A-Kit, although they work too.

- **Install A-Kit** by double-clicking on **AKit-Install**. This will install:
  - **A-Kit's plugins** in your **Vstplugins**' folder.
  - Standalone **a-registration** required for registration of a-kit in your **Vstplugins**' folder.
  - **Aliases of a-registration.exe** on your desktop and in your **Start Menu**.
