- Fibre Channel Routers - FCR Training
- FCR & Scalar 218FC Configuration
- FC Configuration:
 - ‡ Operating Systems
 - ‡ Host Bus Adapter drivers & parameters

Networking & Fibre Channel Basics

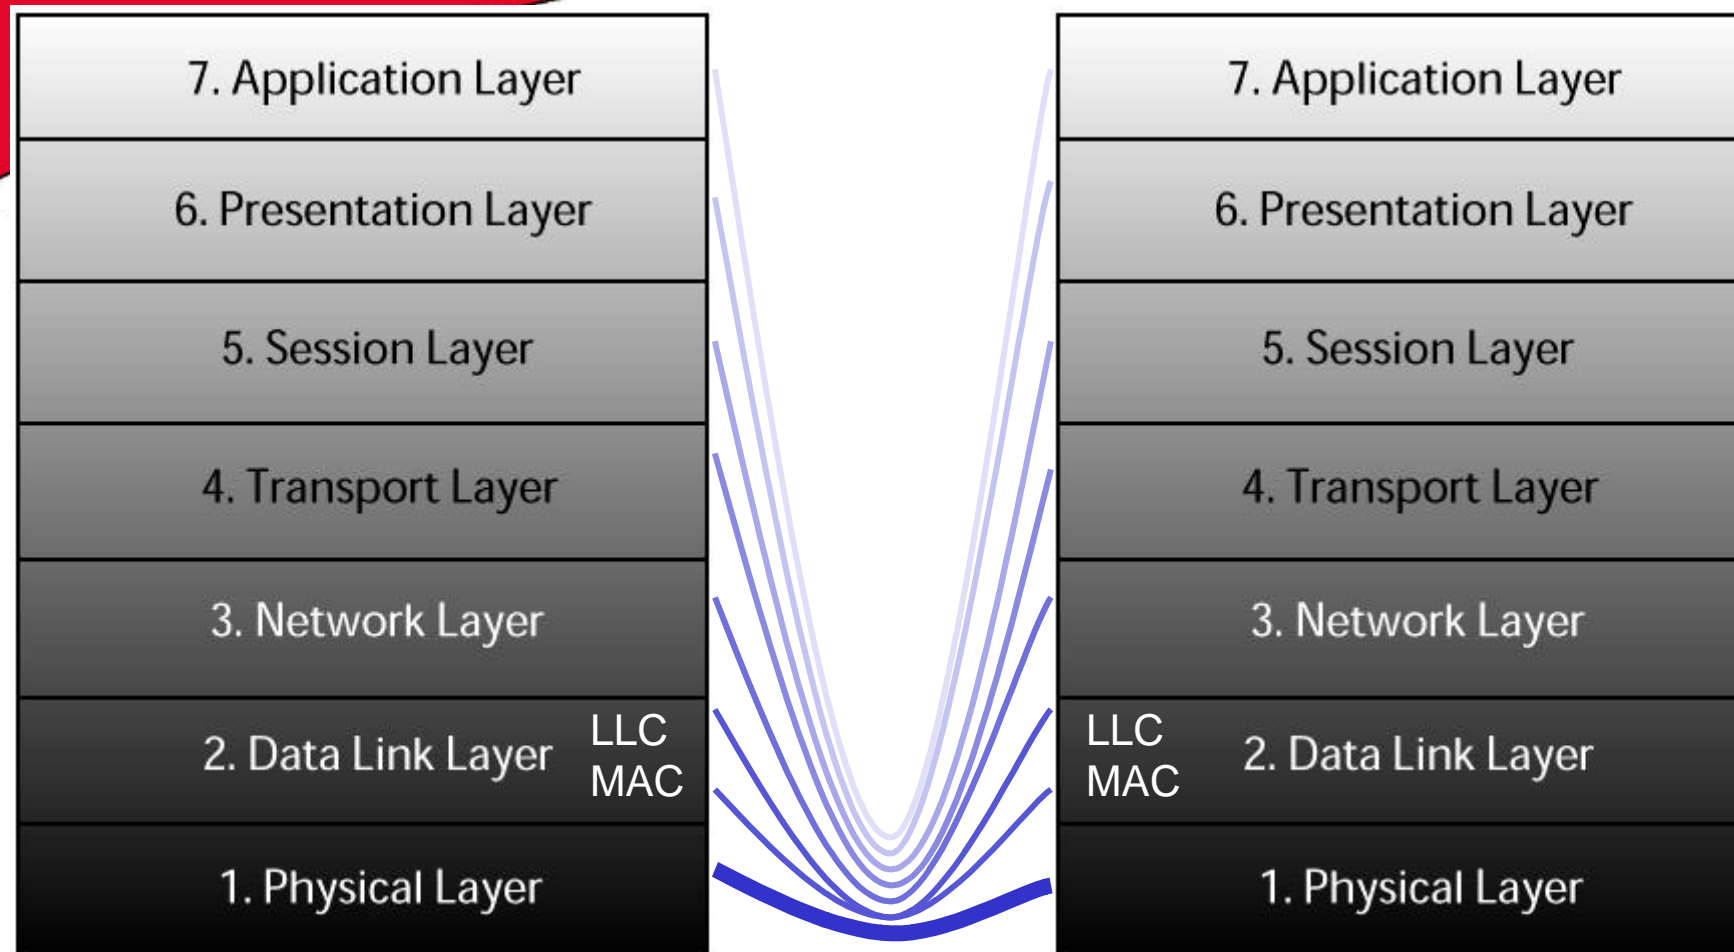

→ Network/Transport Layer: TCP/IP

→ Data Link (Logical Link Control) Layer: Ethernet, Token Ring, ATM, ESCON, Gigabit Ethernet

→ Data Link (Media Access Control) Layer: FDDI, Fibre Channel, 10BaseT, 100BaseT

→ Physical Layer: Copper Cable, Fiber Optic Cable

Sender at each layer communicates with receiver's same layer
Physical is the only layer with an actual connection

7. Applicatio

6. Presentatio

5. Session L

4. Transport

3. Network

2. Data Link

1. Physical

→ Unshielded Twisted Pair:
10BaseT, 100BaseT, Gigabit Ethernet over Copper;
T1, T3, POTS, ISDN, ADSL, Frame Relay

→ Shielded Twisted Pair:
Token Ring, FC over Copper = 25 meters max

→ “Thinnet” (RG58): 10Base2 (10Mbps)

→ Parallel Cabling:
SCSI, IDE, Parallel (printer) ports on PC Systems

→ 2 Glass Fibers, each in its own casing

→ Multimode: signals refract off multiple paths as they travel; 62.5 micron = 500 meters max

Single mode: signal runs down a single path as it travels; 7 microns wide = 10 km max

→ Supports FDDI, FC, Gigabit Ethernet, etc.

7. Applicatio

6. Presentatio

5. Session L

4. Transport

3. Network

2. Data Link

1. Physical

- GLM: Gigabit Link Module
- Mounted onto HBA or Motherboard
Difficult to replace or upgrade
- GBIC: Gigabit Interface Converter
- Plugs into Socket on HBA,
Motherboard, Hub, Switch, etc.
Easy to replace or upgrade

Gigabit Link
Module

Gigabit Interface Converter

7. Applicatio

6. Presentatio

5. Session L

4. Transport

3. Network

2. Data Link
MAC

1. Physical

- 100 Mbps
- Up to 500 nodes over 100KM
- Token-Passing
- Ring Topology
- Rings are Redundant

7. Applicatio

6. Presentatio

5. Session L

4. Transport

3. Network

2. Data Link
MAC

1. Physical

→ Shared: Hub allows only 1 pair of systems at a time to connect

→ Switched: Switch allows several point to point data paths at a time

→ 10BaseT, 100BaseT, Gigabit Ethernet can all use twisted-pair

7. Applicatio

6. Presentatio

5. Session l

4. Transport

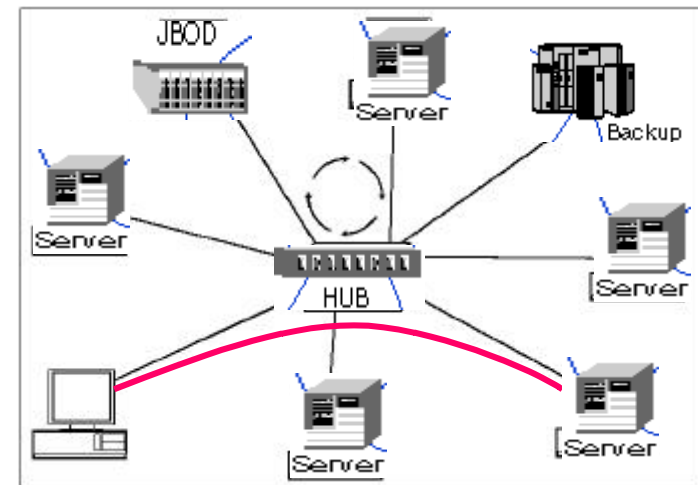

3. Network

2. Data Link
MAC

1. Physical

→ FC-AL = Arbitrated Loop:
Hub used to centralize
connections, but “loop”
allows only 1 data path at a
time

→ FC-Switched:
Switch allows several point
to point data paths at a
time

7. Applicatio

6. Presentatio

5. Session L

4. Transport

3. Network

LLC

2. Data Link

1. Physical

→ Token Ring: uses larger data packets; 4-16 Mbps

→ Ethernet: Shared or Switched; 10, 100, 600 Mbps

→ ATM: Switched; large packets; 155 Mbps

→ ESCON: Enterprise System Connect (IBM)

7. Applicatio

6. Presentatic

5. Session I

4. Transport

3. Network

2. Data Link

1. Physical

- Internet Protocol
- Sends data from IP address to IP address
- IP Addresses are Logical: 1 adapter can have multiple IP addresses
- IP Attaches to Data Link Layer (Ethernet, Token Ring, FC, etc) to gain transport to other IP addresses

- Transmission Control Protocol
- Establishes TCP “session” from TCP port to TCP port
- Sends data from application “socket” to application “socket” in software; each socket gets its own TCP port
- If TCP session is between TCP ports at different IP Addresses, IP is used to transport data

7. Applicatio
6. Presentatio
5. Session L
4. Transport
3. Network
2. Data Link
1. Physical

- Parallel Data Transmission
- Designed for Very Large Packets & High I/O
- SCSI over Copper (50-pin, 68-pin, etc) most common
- SCSI over FC is newer, faster, runs farther

"LLC"

SCSI & LAN Setup for Tape Libraries

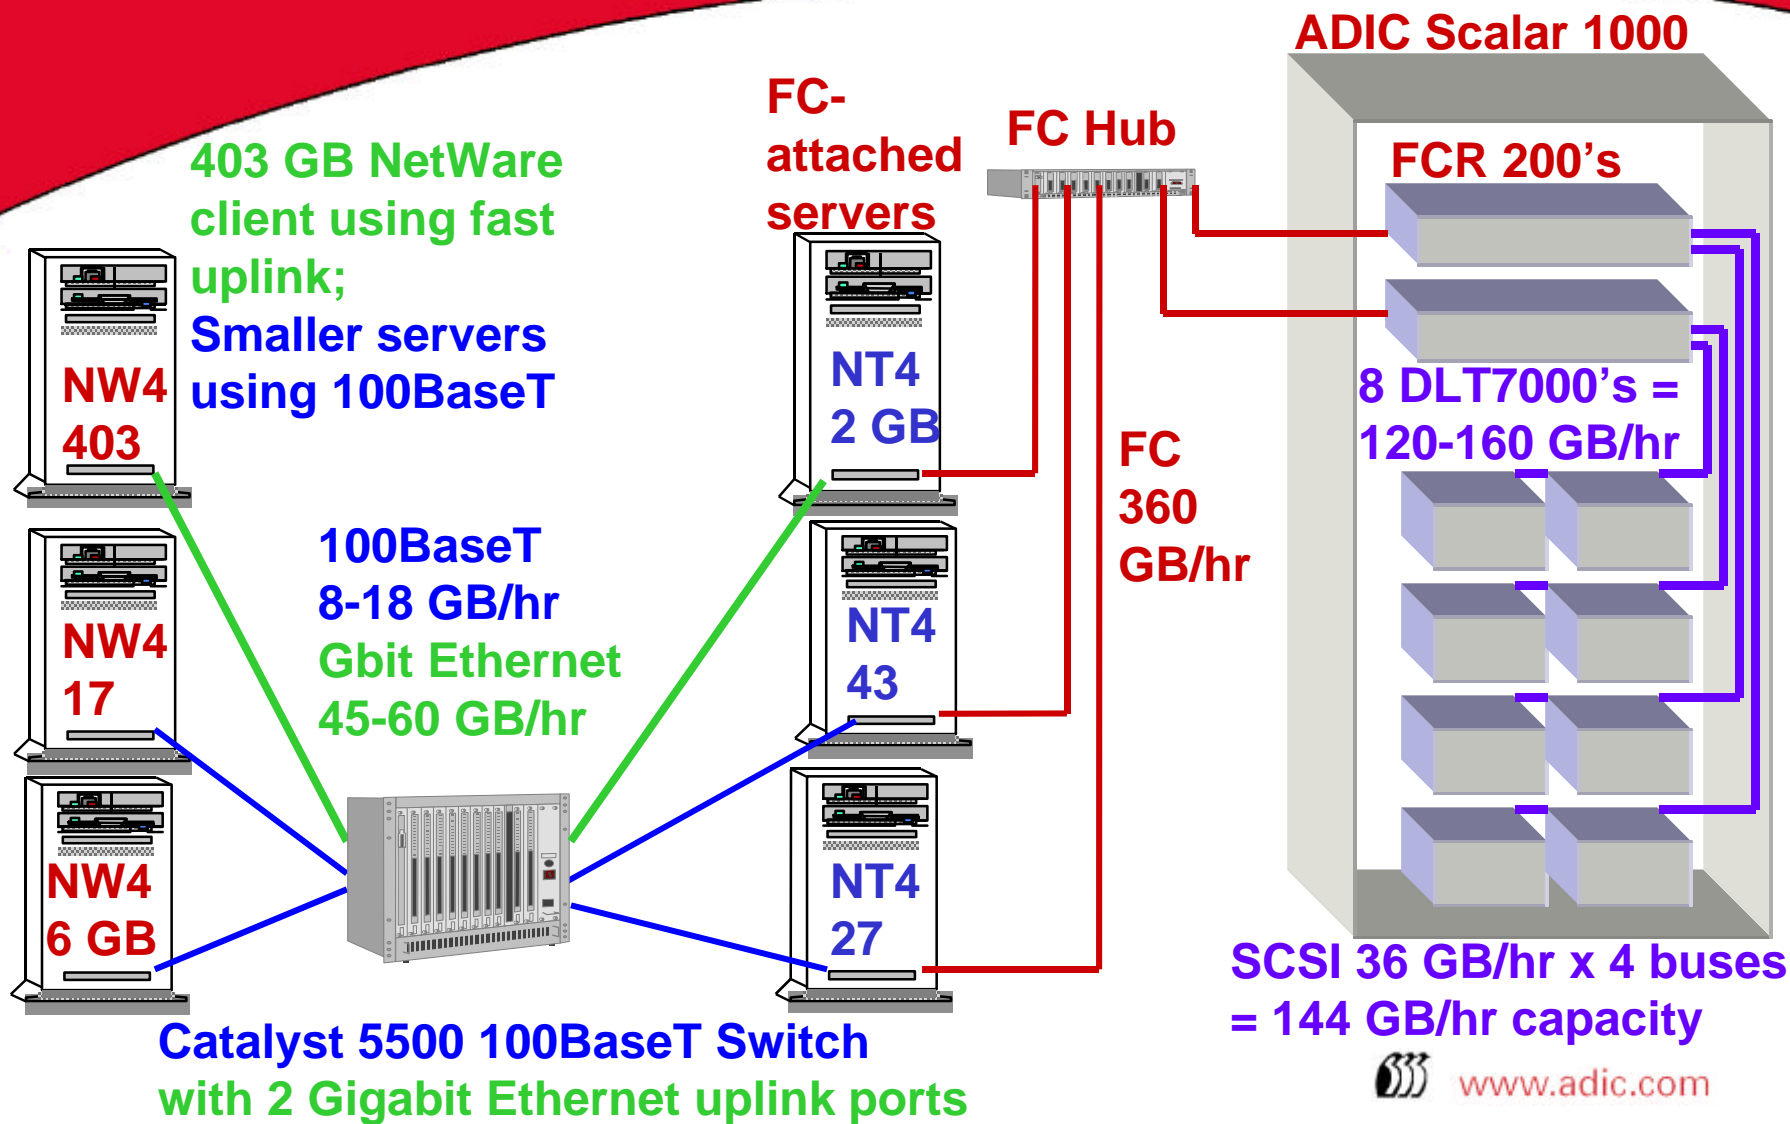

FC SAN Setup for Tape Libraries

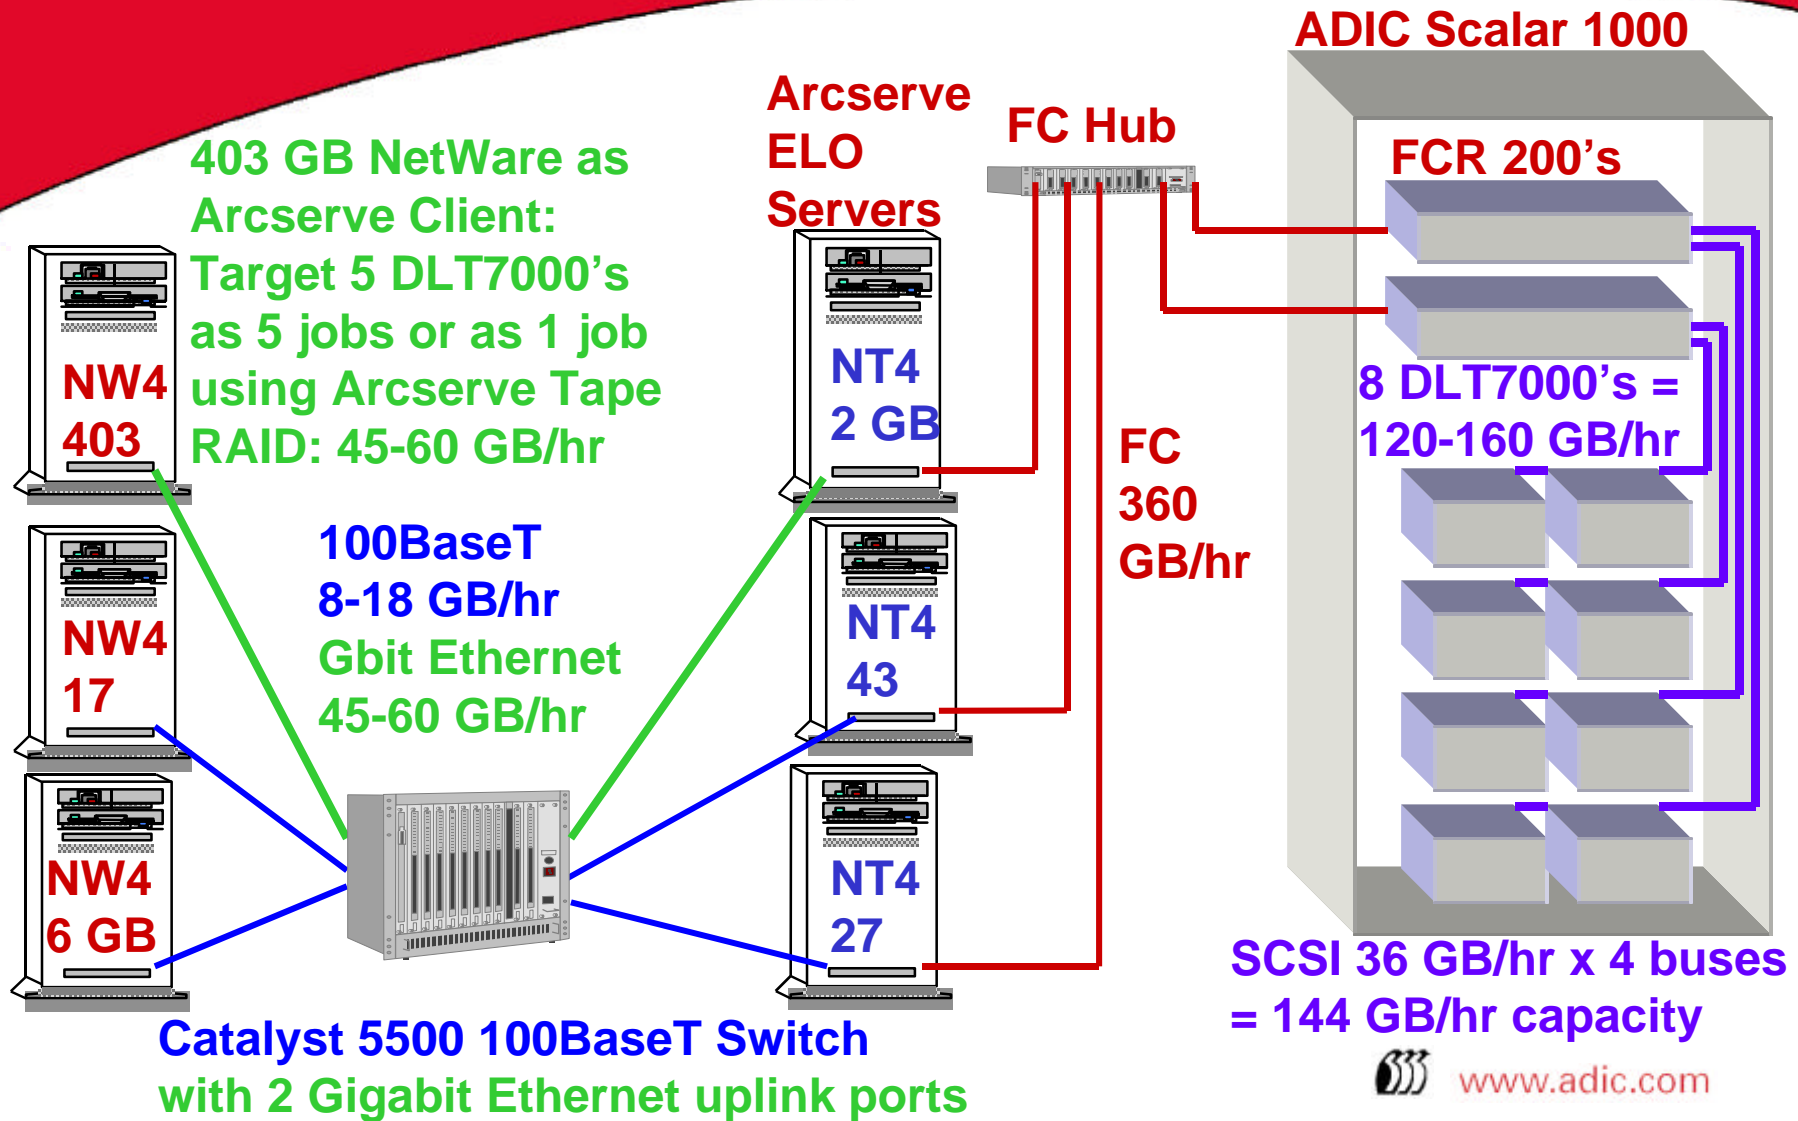

FC SAN Setup using High Speed Network Uplinks

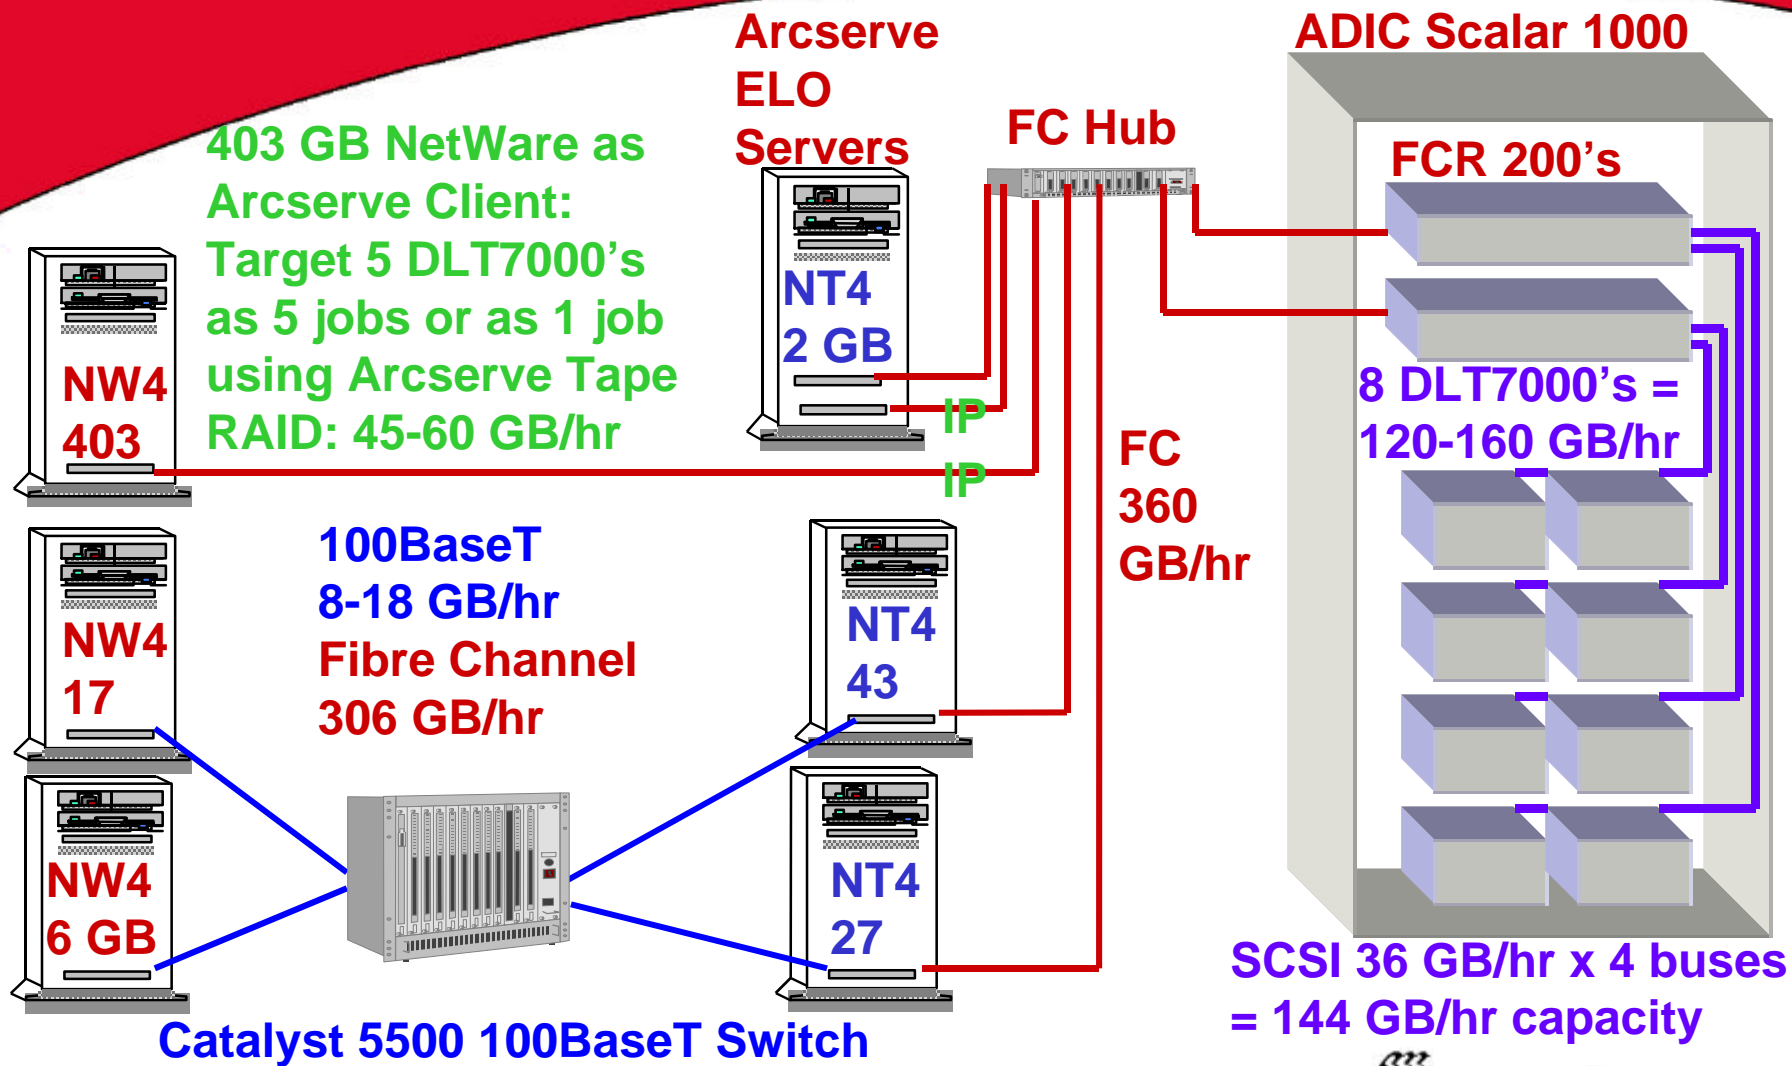

Backing up 403 GB NetWare 4 Server using Arcserve/NT ELO: TCP/IP over Gigabit Ethernet

Backing up NetWare Server via Arcserve/NT ELO: TCP/IP over FC

SCSI Concepts & Basics

- **SCSI 1 – Original SCSI Specification, Loosely Defined**
- **SCSI 2 – Standard SCSI, Clean up of SCSI 1 and addition of advanced features (ADIC Devices)**
- **SCSI3 – Still not formally defined, double speed of SCSI 2**

SCSI Standard	SCSI Type	Speed	Cable Length		Adaptec Examples
			SE	DE	
SCSI 1	Narrow	5MBps	18'	75'	
SCSI 2	Narrow	5MBps	18'	75'	AHA-152X
SCSI 2	Fast	10MBps	9'	75'	AHA-154X, 274X, 294X
SCSI 2	Fast Wide	20MBps	9'	75'	AHA-2940W
SCSI 3	Ultra	20MBps	4.5'	75'	AHA-2940 U
SCSI 3	Ultra Wide	40MBps	4.5'	75'	AHA-2940 UW
SCSI 3	Ultra 2, LVD	80MBps	4.5'	40'	AHA-2940U2W

ADIC Product Cable Lengths

Product	Internal Cable	Maximum External Cable Length*	
		SE	DE
Scalar 224,234,448,458	3' + drives	6'	72'
Scalar 218	1' + drives	8'	74'
Scalar 1000	0' + drives	n/a	75'
Scalar AIT 480	6'	n/a	69'
Scalar AIT 220	3'	n/a	72'
FastStor	1'	8'	74'
VLS 4mm, SDX, DLT	2'	7'	73'
Standalone Drives	1'	8'	74'

* Assuming Fast Wide (20 MB/sec) devices on HD68 cables; if attaching Ultra Wide (40 MB/sec) devices, max. SE cable length drops from 9' to 4.5'

Single Ended

All signals referenced to common ground

Active termination required (Use only ADIC-Supplied)

Good for short cable length environments

More sensitive to noise/signal integrity

 Differential Ended

Signal levels obtained from difference of 2 separate signals

Active termination not available

Good for longer cable length environments

 No Support Distinction

Apps and Operating Systems that support SE support DE

 SE and DE Devices can not be mixed on the same bus

- **Termination**

- Each end of the SCSI bus must be terminated**
 - Active Terminators required (ADIC Supplies Only)**
 - Specific Differential Terminator required**
 - All ADIC devices supply Term Power to the SCSI bus as default**

- **Cable Quality**

- Many manufacturers of cable with different quality/electrical characteristics**
 - Poor quality cables directly impact signal integrity**
 - ADIC cables are certified internally – strongly recommended**
 - DE vs. SE**

- **LVD (Low Voltage Differential)**
Double speeds of Ultra Wide SCSI

Long transmission lengths

Can not mix regular differential (HVD) and low voltage differential devices on an LVD bus

Can convert bus to Single Ended: attaching a single-ended device converts bus to single-ended transmission

Cable Length over spec

Cable Quality under spec

Connector Confusion

Termination not installed or low quality

Connector Coming Loose

Bent Connector Pin

Troubleshooting & Fault Isolation

Offline testing (no SCSI bus, ADIC terminator on robotics)

Online utilities (using SCSI BIOS, DOS ASPI, server OS, and/or backup software utilities to examine/exercise)

Offline ASPI utilities (using bench PC or notebook w/SCSI)

Online Backup Software

→What stage of Setup?

→Software & hardware both new,
not installed yet

→Software installed already,
Hardware is new

→Software & hardware both
installed already, was working ok

→Typical Problem Discovery:

→Software install fails; software fails to
find hardware or reports it's unsupported

→Software can't see or configure new
device; software's tech support says
device may be bad

→Software error message pointing to
hardware; software's tech support says
device may be bad

→What stage of Setup?

→One or more drives failed in existing library

→One or more drives replaced in existing library

→New drives / slots / FCR's added to existing library

→Typical Problem Discovery:

→Software operation fails; software fails to mark hardware offline

→Software can't see or configure new device; software fails to mark hardware online

→Software loses drive associations to library; software identifies this as a new library & reports it can't find the old one

→ Check Customer's Isolation Steps:

→ Were they clean, or were several variables changed at once?

→ Can the problem be duplicated?

→ Does customer have ADIC and/or software company incident numbers/calls?

→ Isolate Problem to ADIC Unit:

→ Does swapping in a known good unit remove problem behavior?

→ Does swapping unit to a known good system continue problem behavior?

→ Typical Isolation Items:

- Server hardware (SCSI cards, RAM, CPUs, or the entire server)
- ADIC Robotic Unit
- Tapes
- SCSI Cables: Make/model, length, routing
- SCSI Terminators
- Physical location
- Power source
- Server down/restart
- Server power cycle
- Software unload/reload
- Software threads killed/restarted
- Server I/O load high/low
- LAN activity high/low
- OS/Software Drivers
- SCSI Card Drivers
- OS Patches
- Data volume or capacity increase
- Other software processes added to server

→ Is the software/robot/OS setup compatible?

→ Are the robot, server, Operating System, and software setup right?

→ Marketing Compatibility Guide:
At www.adic.com

→ Tech Compatibility Guide: call ADIC sales or Tech Support at 800-336-1233

→ Hardware manuals

→ Software manuals

→ NT device files

→ NetWare startup NCF's

→ UNIX conf/def/dev files

→ Software configuration & startup files

→ Any history on this setup, unit or customer?

→ Any glitches & gotcha's for this OS/software/hardware setup?

→ Your contact or incident database information

→ ADIC Tech Support incident history information

→ Software Release Notes

→ Software WWW bulletins

System Performance & Throughput

- Type of Data
- Location of Data
- I/O Path to Data
- Host Processor
- Backup Software
- I/O Path to Tape
- Tape Media/Drive

- Type of Data: Large files back up faster than small files
- Flat files vs. Database files: Database agents may be more or less efficient than the operating system
- Compressibility: Tape drives' throughput and capacities are rated at 2:1 compression; LAN data may compress at 1.5:1 or less

- Disks: Hardware RAID faster than OS (software) RAID
- RAID card RAM: Adding RAM beyond card's midrange may have diminishing returns
- Network Speed: 100BaseT popular, but real speeds limited
- Network Switches: increase multi-server network capacity
- Faster Network Technologies: Enterprise switches can grow as new LAN and/or SAN uplink ports reach the market

- CPU Speed: Faster is Better; retired PC servers will yield retired-PC throughput speeds
- CPU Design: Pentium Pro designed for higher I/O, Pentium II designed for more computation
- # of CPUs: Many backup packages can use 1 or more CPU per data stream
- OS CPU Support: OS Versions that support multiple CPUs provide a speed advantage

- Backup Software: File System Backup Slower than Image Backup
- Backup Agents: LAN-bound data streams can double in speed with use of agents to “package” data stream
- # of SCSI cards to Tape Drives: Trade-off between SCSI bus capacities and PCI and/or EISA bus Bridging Issues
- Drives & Media: Must have throughput capacity high enough for backup system

Isolating Throughput Issues

- Establish a Baseline Directory of test data
- Start Small: Use a 10MB Test before sending 1GB
- Use Real Data typical for your network: if your backups tend to compress at 1.4:1, use data that compresses at about the same rate
- Use the same data set every time
- Save the test data set for future tests and problem isolation sessions

- Servers (minimum of 3)
- Servers' Disks

- Network Switch
- Tape Device

Test	Source	Target	Measures	Throughput (MB/Minute)	Notes
1	Backup C:	Tape	Local speed to tape		Should match point on Price/Performance Curve
2	Backup C:	Backup C:	Local speed to disk		If much different than (1), check SCSI or tape issues
3	NT1 C:	NT1 C:	NT1's disk speed		Should be similar to (2) if servers are similar
4	NT1 C:	NT2 C:	NT1's LAN disk speed		If much less than disk, check LAN issues
			NT1's speed to Backup		Should be similar to (4) if netcards are similar
6	NT1 C:	Backup Tape	NT1's speed to tape		If much less than (5), examine SCSI and tape issues

Throughput numbers shown for illustration only. Only you can determine your system performance!

Test	Source	Target	Measures	Throughput (MB/Minute)	Notes
1	Backup C:	Tape	Local speed to tape	400	Should match point on Price/Performance Curve
2	Backup C:	Backup C:	Local speed to disk	350	If much different than (1), check SCSI or tape issues
3	NT1 C:	NT1 C:	NT1's disk speed	340	Should be similar to (2) if servers are similar
4	NT1 C:	NT2 C:	NT1's LAN disk speed	80	If much less than disk, check LAN issues
			NT1's speed to Backup		Should be similar to (4) if netcards are similar
6	NT1 C:	Backup Tape	NT1's speed to tape	40	If much less than (5), examine SCSI and tape issues
			Duplexing mismatch		Switchport didn't match netcard
8	NT1 C:	Backup C:	1/2-duplex	120	1/2-duplex faster than full for 1-way I/O
9	NT1 C:	Backup Tape	Backup Agent	240	Installed agent on NT1
10	NT1+NT2 C:	Backup Tape	Dual Stream Backup	240	Netcard on Backup Server Bottleneck?
11	NT1+NT2 C:	Backup Tape	Fast Uplink	400	Installed faster uplink on Backup server

Throughput numbers shown for illustration only. Only you can determine your system performance!
