

NAME

psi – Single-precision psi(x)

SYNOPSIS

Fortran (77, 90, 95, HPF):

```
f77 [ flags ] file(s) ... -L/usr/local/lib -lgjl
```

```
REAL FUNCTION psi(x)
```

```
REAL x
```

C (K&R, 89, 99), C++ (98):

```
cc [ flags ] -I/usr/local/include file(s) ... -L/usr/local/lib -lgjl
```

Use

```
#include <gampsi.h>
```

to get this prototype:

```
fortran_real psi(const fortran_real * x_);
```

NB: The definition of C/C++ data types **fortran_**xxx, and the mapping of Fortran external names to C/C++ external names, is handled by the C/C++ header file. That way, the same function or subroutine name can be used in C, C++, and Fortran code, independent of compiler conventions for mangling of external names in these programming languages.

Last code modification: 03-Aug-2000

DESCRIPTION

Compute and return the value of the **psi(x)** function for single-precision **x**.

The **psi(x)** function is the logarithmic derivative of the Gamma(x) function:

$$\mathbf{psi(x)} = d/dx (\text{Gamma}(x)) / \text{Gamma}(x) = d/dx (\ln \text{Gamma}(x))$$

This code correctly handles the case where **x** is NaN, for which **psi(NaN)** is a NaN, and the case where **x** is sufficiently large and positive, or takes one of the integer values 0, -1, -2, -3, ..., for which **psi(x)** = +Infinity, a special value in IEEE 754 arithmetic.

This code is derived from code given by

W. J. Cody

Algorithm 715: SPECFUN --- A Portable FORTRAN

Package of Special Function Routines and Test Drivers

ACM Trans. Math. Software 19(1) 22--32, March 1993.

but has been augmented for support of IEEE 754 arithmetic, and extended with a new rational Pade approximation for **psi(x)** with **x** in [1,2], and new algorithms for argument reduction.
